Arenula

MCP server suite for the s&box game engine

19	~120	3	8-13K
TOOLS	ACTIONS	SERVERS	TOKENS

Three Servers, One Suite

Each server has a distinct role. The Editor runs inside s&box; the API and Docs servers run standalone.

Editor

Scene manipulation, code compilation, asset management, terrain editing. Runs inside the s&box editor as a C# library plugin.

19 tools SSE :8098 C#

API

Offline type and member reference. Indexes ~1,800 types and ~15,000 members from the s&box CDN schema.

8 tools stdio TypeScript

Docs

Narrative documentation fetcher. Scrapes docs.facepunch.com, converts to Markdown, caches with LRU.

3 tools stdio TypeScript

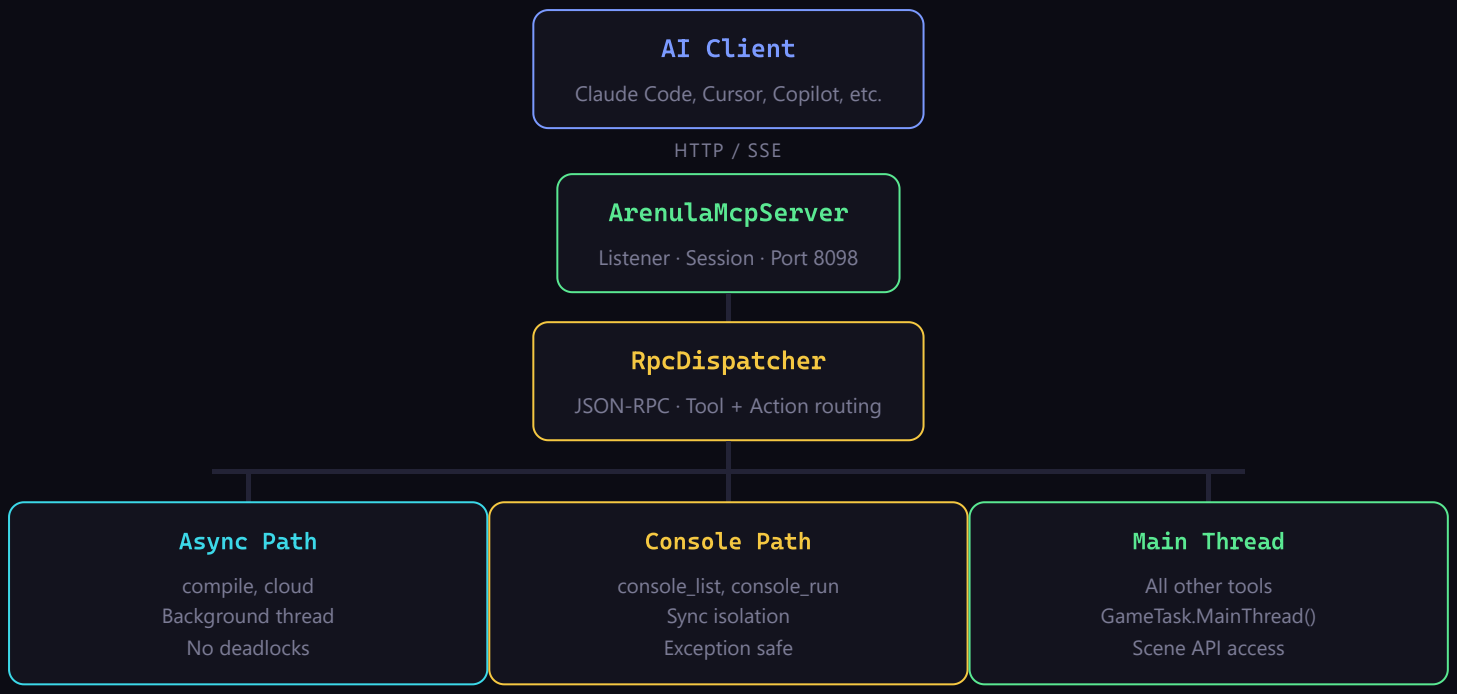
Editor Tools

19 omnibus tools. Each takes a required `action` parameter to select the operation.

scene	summary hierarchy statistics find find_in_radius get_details prefab_instances	7
gameobject	create destroy duplicate reparent rename enable set_tags set_transform batch_transform	9
component	add remove set_property set_enabled get_properties get_types copy	7
compile	trigger status errors generate_solution wait	5
prefab	instantiate get_structure get_instances break update create save_overrides revert get_overrides	9
asset_query	browse search open get_dependencies get_model_info get_material_properties get_mesh_info get_bounds get_unsaved get_status get_json get_references	12
asset_manage	create delete rename move save reload get_references	7
editor	select get_selected set_selected clear_selection frame_selection get_play_state start_play stop_play get_log save_scene save_scene_as undo redo console_list console_run open_code_file get_preferences set_preference	18
session	list set_active load_scene	3
lighting	create configure create_skybox set_skybox	4
physics	add_collider configure_collider add_rigidbody create_model_physics create_character_controller create_joint	6
audio	create configure	2
effects	create configure_particle configure_post_processing	3
camera	create configure capture_viewport	3
mesh	create_block create_clutter set_face_material set_texture_params set_vertex_position set_vertex_color set_vertex_blend get_info	8
navmesh	create_agent create_area create_link generate get_status query_path	6
cloud	search get_package mount	3
project	get_collision set_collision_rule get_input get_info	4
terrain	create configure get_info paint_material sync	5

Architecture

28 C# source files organized into Core infrastructure and per-tool Handlers.



Core 8 files

`ArenulaMcpServer` HTTP/SSE listener and session management. `RpcDispatcher` extracts tool name + action, routes to the correct handler. `ToolRegistry` holds all 19 tool schemas. `HandlerBase` provides response formatting, pagination, and error helpers. `SceneHelpers` handles scene resolution and tree walking.

Handlers 20 files

One file per tool. Each exports a `Handle(action, args)` method with an internal switch on the action enum. Async handlers (`CompileHandler` , `CloudHandler`) use `HandleAsync` and dispatch before `GameTask.MainThread()` to prevent deadlocks.

Threading Model

Scene APIs must run on the main thread. The dispatcher calls `await GameTask.MainThread()` before invoking sync handlers. Async handlers (network/compile) run on the background thread and may internally switch to main thread for specific sub-operations.

Design Principles

Following Anthropic's MCP tool design guidance.

Omnibus Tools

Related operations grouped with action enum parameter. Fewer tools means less selection ambiguity for the LLM.

Rich Descriptions

3-4 sentences per tool explaining what it does, when to use it, and when not to. Negative guidance prevents misuse.

Trimmed Responses

Canonical {id, name} tuples. Pagination with offset/limit. 16K character truncation. Concise and detailed modes.

Actionable Errors

Structured errors with action context and suggestions. Fuzzy type matching: "Did you mean Rigidbody?"

Schema Safety

additionalProperties: false on every schema. Enum constraints on actions and sub-types. Prevents hallucination.

Async Safety

Network tools dispatch before MainThread to avoid deadlocks. Never block the main thread with synchronous waits.

Installation

1. Copy the Editor plugin

```
# Copy into your s&box project's Libraries folder
Arenula-MCP/editor/  ⟶  YourProject/Libraries/arenula_mcp/
```

2. Build the API and Docs servers

```
# From the Arenula-MCP directory
cd api && npm install && npm run build
cd ../docs && npm install && npm run build
```

3. Configure .mcp.json in your project root

```
{
  "mcpServers": {
    "editor": { "type": "sse", "url": "http://localhost:8098/sse" },
    "api":    { "command": "node", "args": ["path/to/Arenula-MCP/api/dist/index.js"] },
    "docs":   { "command": "node", "args": ["path/to/Arenula-MCP/docs/dist/index.js"] }
  }
}
```

4. Open s&box

Arenula Editor compiles automatically and starts the MCP server on port 8098.
